TROPOMI WFM-DOAS (TROPOMI/WFMD) XCH$_4$

Prepared by:

Oliver Schneising

Valid for:

TROPOMI/WFMD

Product	Version
Methane column-averaged dry air mole fraction (XCH$_4$)	v1.8

Contents

Spectrometer	SWIR	
Band ID	7	8
Spectral Range [nm]	$2300 - 2343$	$2343 - 2389$
Spectral Resolution FWHM [nm]	0.227	0.225
Spectral Sampling [nm]	0.094	
Spatial Sampling [km^2]	5.5×7	
Detector Binning Factor	1	

Table 1: Summary of the TROPOMI SWIR spectral bands and their key features (Ludewig, 2021).

1 Purpose of document

This document describes the TROPOMI WFM-DOAS (TROPOMI/WFMD) XCH$_4$ data product and illustrates how to use it.

2 Introduction

2.1 The TROPOMI instrument on Sentinel-5 Precursor

The TROPOspheric Monitoring Instrument (TROPOMI) is a spaceborne nadir viewing spectrometer with bands in the ultraviolet and visible (270-495 nm), the near infrared (675-775 nm) and the shortwave infrared (2305-2385 nm) (Veefkind et al., 2012). TROPOMI combines daily global coverage with a high spatial resolution in order to focus on the troposphere where concentrations of trace gas and aerosol species rapidly change. Light from different wavelength bands is measured by TROPOMI to generate various data products. Some of the species measured by TROPOMI include ozone, nitrogen dioxide, methane, and carbon monoxide.

Sentinel-5P was launched in October 2017 into a sun-synchronous orbit with an equator crossing time of 13:30. TROPOMI's observations of overtone absorptions in the shortwave infrared (SWIR) solar backscattered spectrum yield the vertical columns of CH$_4$ with high sensitivity down to the Earth's surface (Schneising et al., 2019). The instrument has a wide swath of 2600 km consisting of single measurements with a horizontal resolution of typically 5.5×7 km^2 in the SWIR bands (7×7 km^2 before 6 August 2019). The characteristics of the TROPOMI SWIR bands are summarised in Table 1.
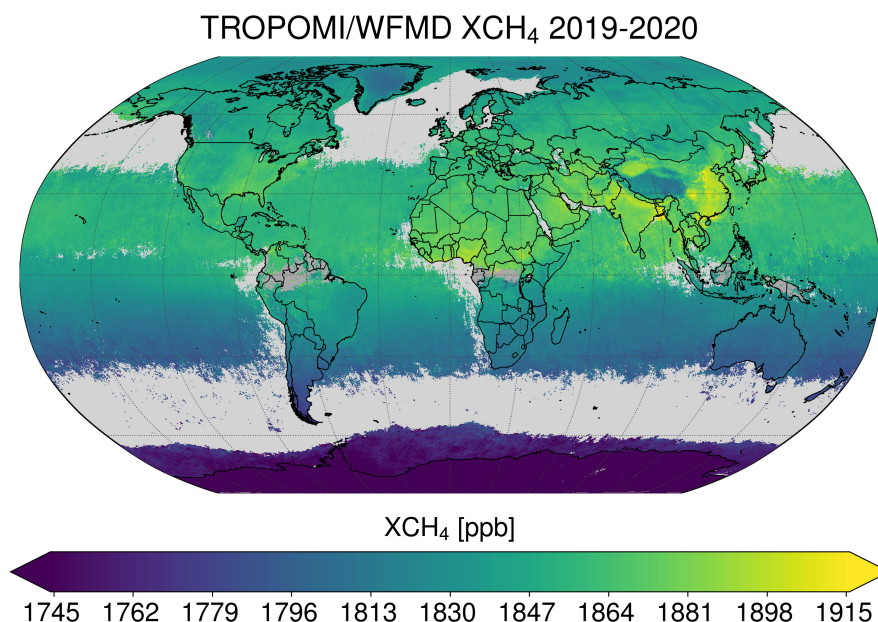

TROPOMI/WFMD XCH$_4$ 2019-2020

Figure 1: Biennial mean (2019-2020) of retrieved TROPOMI/WFMD v1.8 XCH$_4$.

2.2 The WFM-DOAS retrieval algorithm

The Weighting Function Modified Differential Optical Absorption Spectroscopy (WFM-DOAS) algorithm (Buchwitz et al., 2005a,b; Schneising et al., 2008, 2009, 2011, 2012; Heymann et al., 2012a,b; Schneising et al., 2013, 2014a,b, 2019, 2020a,b, 2023) is a least-squares method based on scaling (or shifting) pre-selected atmospheric vertical profiles. The column-averaged dry air mole fractions of methane (denoted XCH$_4$) are derived from the vertical column amounts of CH$_4$ by normalising with the dry air column, which is obtained from the European Centre for Medium-Range Weather Forecasts (ECMWF) ERA5 reanalysis. The corresponding vertical columns of CH$_4$ are retrieved from the measured sun-normalised radiance using spectral fitting windows in the SWIR spectral region (2311-2315.5 nm and 2320-2338 nm).

The global distribution of the retrieved mole fractions XCH$_4$ for the years 2019 and 2020 is shown in Figure 1. Clearly visible is the interhemispheric gradient with larger methane concentrations on the northern hemisphere, where the majority of sources is located, superimposed by enhancements over prominent source regions like anthropogenic emissions from fossil fuels and rice cultivation in China, India, and Southeast Asia. Other visible source regions include tropical wetlands as well as anthropogenic emissions in California or the Padan Plain in Italy.

Table 2: TCCON sites used in the validation ordered according to latitude from north to south (Not all sites are available for a specific TCCON release).

From the validation with ground-based Fourier Transform Spectroscopy (FTS) measurements of the Total Carbon Column Observing Network (TCCON) (Wunch et al., 2011) at the TCCON sites listed in Table 2, realistic error estimates of the satellite data are provided and summarised in Table 3. For the sake of completeness, the error characteristics of XCO, which is simultaneously retrieved with XCH$_4$ and also included in the product, are also quoted.

3 Product description

The data product is based on TROPOMI Level 1b V01.00.00 (V02.00.00 since July 2021) files comprising spectra from the nominal operational mode, which started end of April 2018, and reprocessed spectra from the previous six-month commissioning phase.

	XCH$_4$ (ppb)	XCO (ppb)
Global Offset	4.38 (0.80)	−1.04 (6.23)
Random Error	12.37 (12.42)	5.49 (5.08)
Systematic Error (spatio-temporal)	5.36 (5.27)	3.23 (2.63)

Table 3: Error characterisation of the WFM-DOAS data products (valid for TROPOMI/WFMD v1.8 XCH$_4$ and XCO). The figures of merit are derived for the TCCON release GGG2020. The corresponding numbers for GGG2014 with different spatial and temporal coverage are given in brackets.

3.1 Product content and format

The CH4-TROPOMI-WFMD data products are stored per day in seperate NetCDF-files (NetCDF-4 classic model). The product files contain the key product, i.e. the retrieved column-averaged dry air mole fractions XCH$_4$, as well as the column-averaged dry air mole fractions XCO and several other useful parameters (see Section 3.5 for details). Information relevant for the use of the data is also included in the data file, e.g. the averaging kernels.

3.2 Data usage

The column-averaged dry air mole fractions of methane are stored in the variable `xch4` in the NetCDF product files `ESACCI-GHG-L2-CH4-CO-TROPOMI-WFMD-YYYYMMDD-fv3.nc` (see Section 3.5).

If the data are to be compared with other data for which vertical profile information is available (e.g. comparison to models), the column averaging kernels should be applied to the model profiles using the formula

$$X_{mod} = \sum_l \left(X_{apr}^l + A_l(X_{mod}^l - X_{apr}^l) \right) w_l \tag{1}$$

where l is the index of the vertical layer, A_l the averaging kernel (variables `xch4_averaging_kernel` and `xco_averaging_kernel` in NetCDF product files), X_{apr}^l the a-priori mole fraction (variables `ch4_profile_apriori` and `co_profile_apriori` in product files) and X_{mod}^l the simulated mole fraction of layer l. w_l is the layer dependent pressure weight (variable `pressure_weight` in product files).

3.3 Tools for reading the data

The data are stored in NetCDF format (NetCDF-4 classic model) which can be read with standard tools in the common programming languages (Python, IDL, Matlab, Fortran90, C++, etc).

3.4 Known limitations and issues

The file names `ESACCI-GHG-L2-CH4-CO-TROPOMI-WFMD-YYYYMMDD-fv3.nc` deviate slighty from the GHG-CCI file naming convention to take into a account that a comprehensive carbon monoxide mole fraction data set is also included in the product.

Data density (and potentially also data quality) is lower in the commissioning phase compared to the nominal operational mode, which started end of April 2018. Therefore, one may consider excluding data from the commissioning phase for sensitive applications.
